

Mag. iur. Dr. techn. Michael Sonntag

Web-browsing history

Computer forensics

Institute for Information Processing and Microprocessor Technology (FIM) Johannes Kepler University Linz, Austria

E-Mail: sonntag@fim.uni-linz.ac.at http://www.fim.uni-linz.ac.at/staff/sonntag.htm

© Michael Sonntag 2007

- The elements of web-browsing history and intentionality
- HTTP Hypertext Transfer Protocol
 - → Cookies
- Internet Explorer
 - → File locations
 - → The index.dat file format
 - → Example
- Date/Time formats
- Firefox
 - → File locations
 - → Cookies, history, cache
- Webmail reconstruction example

E

The elements of web-browsing history

- History
 - \rightarrow The list of URLs visited (at which time, ...)
 - → Provides general information on time and location of activity
 » URL's may also contain information: GET requests
 Example: Google searches
- Cookies
 - → Which websites were visited when + additional information
 - May allow determining whether the user was logged in
 - \rightarrow Can survive much longer than the history
 - » Depends on the expiry date of the Cookie and the configuration
- Cache
 - → The content of the pages visited
 » Incomplete: E.g. ad's will rarely be cached
 » See e.g. HTML headers to prevent caching
- → Provides the full content of what was seen, e.g. Webmail Michael Sonntag

Web-browsing history: Intentionality

- Did the user visit the webpage intentionally?
 - → In general: If it's in the cache/history/cookie file: Yes
 - → See also: Bookmarks!
- BUT:
 - → What about pop-ups?
 - » E.g.: Pornography advertisements!
 - → Password protected pages?
 - »But images/JavaScript can easily supply passwords as well when opening a file!
- Investigation of other files, trying it out, content inspection ... needed to verify, whether a page that was visited was actually intended to be visited
 - → Usually this should not be a problem:
 » Logging in to the mail
 » Visiting a website after entering log-ins
- Michael Sonntag
- » Downloading files

Web browsing procedure

- 1. User enters the URL
- 2. Browser determines the IP address for the host part
- 3. Browser connect to the IP address (+port if specified)
- 4. Sends request
 - \rightarrow With additional information, e.g. what compression is allowed
 - → May contain cookie(s)
- 5. Retrieves response
 - → Headers and actual content
 - » Header may contain cookie
 - → Saved to memory (and perhaps the disk in the cache file)
 - » Depends on headers, settings, ...
- 6. Connection is closed
- → Note: HTTP 1.1 may keep the connection open for further requests (incl. pipelining). This e.g. is especially useful for images from the same site!
 Michael Sonntag

The HTTP protocol

- Basis of HTTP is a reliable stream protocol (usually TCP)
- The HTTP state diagram is very simple » With some exceptions, e.g. authorization
 - \rightarrow There is only a single request
 - \rightarrow There is only a single response
- HTTP request methods:
 - → GET: Retrieve some content » Should never change the state on the server! - Especially important if caching takes place somewhere » Parameters (optional) are encoded in the URL \rightarrow POST: Send data for processing and retrieve result » To be used for requests changing the server state! » Parameters are sent in the request body
 - → HEAD, PUT, DELETE, TRACE, OPTIONS, CONNECT » Of less importance

6

The HTTP protocol

- The response always includes a status code
 - → 1xx Informational
 - → 2xx Success
 - → 3xx Redirection (request should be sent again differently)
 - \rightarrow 4xx Client side error (e.g. incorrect request, not existing)
 - → 5xx Server side error (should not be retried)
- Caching of HTTP: Commonly performed through proxies
 - Must either be validated with the source
 - → Or it is "fresh enough" according to client, server, and cache
 - → Note: Browsers often ignore this
 - » E.g. IE can be configured to never check for a newer version even if the cached page is already expired!

The HTTP protocol

• Local (=browser) caches

- → If a page is expired, it is not necessarily deleted from the local cache → It might remain there for much longer
- Can store even pages marked as "no-cache" and "no-store"
 » "no-cache": Should not be cached for future requests
 - But might still be written to disk (e.g. Mozilla)
 - » "no-store": Should only be held in memory
 - Users are still allowed to use "Save As"!
- \rightarrow This cache can be very large and contain very old files
 - » Very important for computer forensics!
 - » Manual deletion or cleaner programs are simple and effective
 - But must be used every time after surfing
 - Attention: Many such programs just delete the files, only the more serious ones overwrite them securely!
 - Also, fragments of files might remain in unused areas, so all free sectors and slack spaces would have to be cleaned every time!

The HTTP protocol example:

http://elearning.fim.uni-linz.ac.at/cms/elearn_ebiz.phtml

GET /cms/elearn_ebiz.phtml HTTP/1.1 Host: elearning.fim.uni-linz.ac.at User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.8.1.7) Gecko/20070914 Firefox/2.0.0.7 Accept: text/xml,application/xml,application/xhtml+xml,text/html;q=0.9,text/plain;q=0.8,image/png,*/*;q=0.5 Accept-Language: en-us,en;q=0.7,de-at;q=0.3 Accept-Encoding: gzip, deflate Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7 Keep-Alive: 300 Connection: keep-alive HTTP/1.1 200 OK Date: Mon, 08 Oct 2007 13:36:22 GMT Server: Apache/1.3.34 (Debian) Set-Cookie: hashID=22d68c8b5698827d57f071f43d818456; path=/ Page, not Cookie! Expires: Thu, 19 Nov 1981 08:52:00 GMT -Cache-Control: no-store, no-cache, must-revalidate, post-check=0, pre-check=0 Pragma: no-cache Keep-Alive: timeout=15, max=100 Connection: Keep-Alive Transfer-Encoding: chunked Content-Type: text/html; charset=iso-8859-1 Michael Sonntag

What is a "cookie"? \rightarrow Small (max. 4 kB) text file with information » Originates form the server » Stored locally » Transmitted back to server on "matching" requests \rightarrow Content (with exemplary data): » Name: "session-id" » Value: "303-1195544-4348244" » Domain: ".amazon.de"] Sent to all requests ("/") of subdomains of ".amazon.de" » Website path: "/" None \rightarrow Till browser is » Expiry date and time: 15.10.2007, 00:02:22 closed ("session cookie") » Secure(https): * Will be sent also on non-HTTPS connections The data may have any meaning \rightarrow Very rarely this is some "plain-text data" Some part of it might be the IP address or the user name But usually it is just a (more or less!) random unique number

Michael Sonntag

Internet Explorer: Interesting files/locations

Where can we find information on what users did with IE?

- » Att.: Locations change slightly with operating system version!
- → <User profile>\Local Settings\Temporary Internet Files\ Content.IE5
 - » Cache (webpages, images, applets, flash-files, ...)
- → <User profile>\Local Settings\History
 - » Where the user had been (URLs);
 - » Subdirectories for various time spans
- → <User profile>\Cookies
 » Cookies

• Note: Data is deleted from these locations independently!

→ What is (was) present in one, is not necessarily available any more in the other locations

» We must search all three locations and assemble the results

Internet Explorer: Cookie file structure

Each cookie file contains all cookies for a single domain

- \rightarrow The information is stored line-by-line; 9 lines = 1 cookie
- Example:

```
__utma Name

36557369.378120483.1187701792.1189418701.1190710388.4 Value

hotel.at/ Domain

1088 Flags

2350186496

32111674 Expiration time (UTC; LoVal","HiVal)

2116717664

29884241 Creation time (UTC)

* Secure (here: False)
```

__utmb

- Note: Additional information on the cookies is in the index.dat file in the same directory!
 - → Number of hits, suspected as advertisement

Internet Explorer: index.dat structure (1)

- This structure is the same for cookies, cache, and history
- Overall structure:

Michael Sonntag

- » Remember: File has bytes in reverse order (little endian)!
- → Header: Magic number (text), file size, hash table offset, subdirectory names (cache only)
 - » Subdirectory names are referred to by index (0 = first)
- → Hash table: Length of table, pointer to next hash table, 8-byte hash entries
 - » Entries: 4 bytes flags, 4 bytes record offset
- → Activity records: Type, length, data (dependent on type)
 - » Type can be REDR, URL, or LEAK
 - URL: Website visit
 - REDR: Redirection to another URL
 - LEAK: Purpose unknown
 - » Each record is a multiple of 128 bytes long

Source: http://odessa.sourceforge.net/

Internet Explorer: index.dat structure (2)

URL records

- → Last modified time: When the information was modified on the web server
 - » Filetime format; All zero if unknown
- → Last access time: When the URL was visited » Filetime format!
- → URL offset
 - » URL itself is Null-terminated; no Unicode ASCII only!
- → Filename offset
 - » The name in the cache directory
- → Cache directory index
 - » In which cache directory the file is stored (index; 0 = first dir!)
- → HTTP header offset
 - » The response headers only; not always present
 - Hit count: How often visited (location unknown)

Internet Explorer: index.dat structure (3)

REDR records

- → Flags: Exact meaning unknown
- → URL offset
 - » Null-terminated
- LEAK records
 - Structure similar to URL record
 - → Purpose unknown

Not all records are necessarily present in the hash table

- → When deleted, sometimes a record remains, and only the hash entry is removed
- → As all records are block-sized (see before), "undelete" is possible without too many problems!
 - » Especially as each record starts with the type, and destroyed records are filled with well-known values (0x0BADF00D)

Internet Explorer: index.dat example

• Screenshot of header:

<Not present in file>

Computer forensics: Web-browsing history 18

9.10.2007, 9:18:48 UTC

- Output from Pasco:
 - → Type: URL
 - → URL: http://www.amazon.de/Computer-Forensics-Library-Boxed-Set/dp/0321525647/ref=sr_1_14/302-3061595-9808016?ie=UTF8&s=books-intl-de&qid=1191921357&sr=8-14
 - → Modified time:
 - → Last accessed time: 10/09/2007 11:18:48
 - → Filename: 302-3061595-9808016[2].htm
 - Directory: BRNONATM
 - → HTTP headers: HTTP/1.1 200 OK Content-Length: 120986 Content-Type: text/html
- Other data:
 - → Record length: 3 (=3*128 = 384 bytes = 0x180)
 - > From 0x035800 to 0x35980

Internet Explorer: index.dat example

Sidetrack: Date/time formats

• Filetime: Number of ticks since 1.1.1601

- → UTC; 100 ns resolution
- → Usually stored as 8 hexadecimal numbers
- Unix time: Number of ticks since 1.1.1970
 - \rightarrow UTC, 1 s resolution
 - → May appear as hexadecimal or decimal value (take care!) » Hex: 9940F039 » Dec: 971815414
- Attention:
 - → Big endian or little endian?
 - → UTC or a different time zone? Which?

» Windows NT stores everything as GMT (according to its own time zone as configured)

 \rightarrow Difference of system time to actual time?

Michael Sonntag

Nice tool: http://www.digital-detective.co.uk/freetools/decode.asp Computer forensics: Web-browsing history 19

Sidetrack: Date/time formats Examples

index.dat example: Filetime – Little endian
 → B02D8366550AC801 = Tue, 09 October 2007 09:18:48 UTC
 » Actually: Di, 09 Oktober 2007 11:18:48 +0200

• Cookie example (expiration time; Windows Cookie time):

- → 2350186496,32111674 = 25.9.2007 08:53:07 UTC
- Firefox cookie (Unix numeric timestamp):
 - → 1192658552 = 17.10.2007 22:02:32 UTC

Sidetrack: Date/time formats Time zone, DST, and delta

• Time zone issues:

 \rightarrow Identify time zone from installation » Alternative: Geographical area of usage of the system Attention: Summer time ("daylight saving time", "DST")! \rightarrow Now its UTC+1, but at some dates it's UTC+2! – Austria: 25.3.2007-28.10.2007 → UTC+2; Rest of year: UTC+1 » Note: Dates of start/end changed over the years - Was the corresponding patch applied to the computer? When? - Windows: Registry stores start/end date, ... → Does the system account for this? » Timestamp stored as UTC or local time? - NTFS: UTC; but FAT: Local time Delta: Identify delta between computer time and UTC \rightarrow Attention: This might not necessarily be the same delta as when the timestamp was created! » Manual corrections, time drift (important for longer timespans) Michael Sonntag Computer forensics: Web-browsing history

Internet Explorer: Cache information

Information is stored in the file "index.dat"

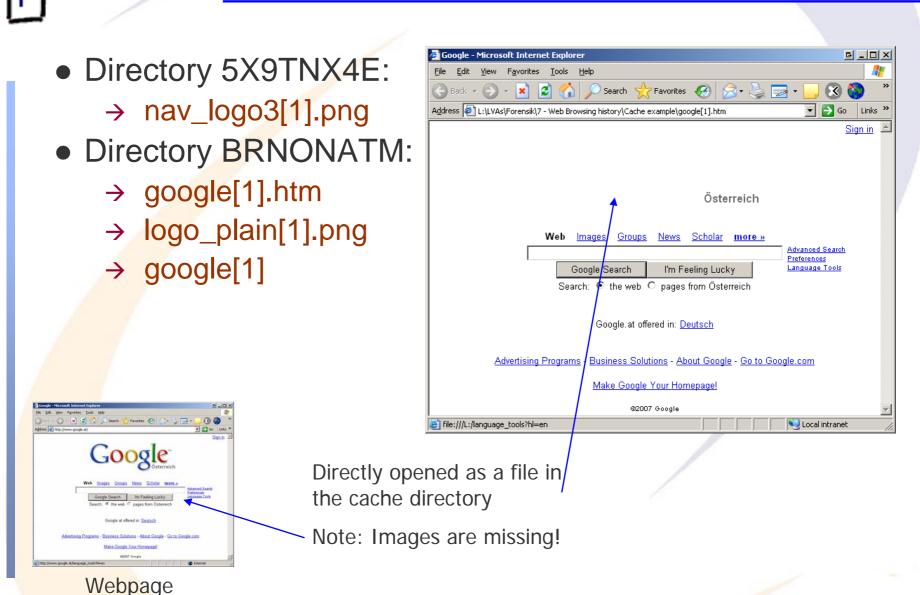

- → File format see before!
- → Again: Content is not necessarily the same as in other files
- Additionally: Several subdirectories for the actual files
 - → Note: These receive "random" filenames to avoid collisions » Typically with "[1]", "[2"], ... added at the end
 - » The files itself are NOT modified; URL's are kept the same!
 - Recreating pages: Must "load" the URLs from the cache too
 - "Transparent proxy" is needed
- The URL also contains GET parameters

→ These might also be interesting!

http://www.hotel.de/Booking.aspx?h_rooms=1&h_fbrs=1&h_step=3&h_departure=9/1/2007&h_arrival=8/26/20 07&h_rmod=0&h_sbl=/Search.aspx?hs_arrival=8/26/2007&hs_destination=Lübeck&hs_circum=0&hs_landi soa3=DEU&hs_locationnr=37547&hs=2&hs_departure=9/1/2007&hs_ltype=1&hs_validate=2&hs_llat=53,8 6626&Ing=EN&hs_llong=10,67468&Ing=EN&h_persons=1&h_validate=1&h_hmid=50727&h_persons_total =1

Booking a hotel for one person in Lübeck (Germany) from 26.8.2007 till 1.9.2007

Internet Explorer: Cache directory example

Michael Sonntag

Firefox: Interesting files/locations

Where can we find data on what users did with Firefox? » Profile ID is a random string generated once \rightarrow <User profile>\Local Settings\Application Data\Mozilla\ Firefox\Profiles\<Profile ID>\ Cache » Cache (webpages, images, applets, flash-files, ...) \rightarrow <User profile>\Application Data\Mozilla\ Firefox\Profiles\<Profile ID>\ history.dat » Extremely strange file format ("Mork") » There does exist an exporter ("Dork") \rightarrow <User profile>\Application Data\Mozilla\ Firefox\Profiles\<Profile ID>\ cookies.txt » Cookies; Tab-delimited text file Easy cache access: URL "about:cache" \rightarrow Also extensions available for directly viewing cached files » Should only be used on write-protected disks/images! → Firefox has two caches: In-memory and on disk Computer forensics: Web-browsing history Michael Sonntag

• Simple text file with tab-delimiters: Single line per cookie

• Format:

- → Domain: ".amazon.de"
- → Domain access: "TRUE"
 - » Probably a security setting
- \rightarrow Path: "/"
- → Secure : "FALSE" (= Sent over any type of connection)
- → Timestamp: 1192658552 (=17.10.2007 22:02:32 UTC) - Local time: Do, 18 Oktober 2007 00:02:32 +0200 (Sommerzeit!)
 - » Format: Unix numeric value
- → Name: "session-id"
- → Value: " 302-0868837-0800841"
- Example:

 →
 .amazon.de
 TRUE
 /

 Michael Sonntag
 Session-id
 302-0868837-0800841

FALSE 1192658552

Firefox: History file

- Stored in a "strange" format, a kind of database
 - \rightarrow To be probably replaced in version 3 with a real DB!
- Currently: Very difficult to parse, except through Firefox
 - → But there is an exporter, generating a tab-delimited file
- Example:
 - → C7D0D 3 2007-10-08 14:44:44 2007-10-08 14:47:07 http://www.amazon.de/ref=rd_www_amazon_at/?site-redirect=at
 - → ID of the visit: C7D0D
 - \rightarrow Visit count: 3
 - → First visit date: 2007-10-08 14:44:44
 - → Last visit date: 2007-10-08 14:47:07
 - → URL: http://www.amazon.de/.....

\rightarrow Take care of time zone of dates!

Firefox: Cache

• The cache consists of 4 files plus the data files \rightarrow 1 cache map: Hash table for entries ("_CACHE_MAP_") » Header plus 8192 records of cached elements Record: Hash number, eviction rank, data / metadata location » Data may be saved within cache block file (below) or separately \rightarrow 3 cache block files ("_CACHE_00?_") » Bitmap header and some cache content and/or metadata » Varying block sizes: cache 1 = 256, 2 = 512, 3 = 1024 Bytes - Maximum block count per data: 3 (\rightarrow up to 3072 Bytes) \rightarrow Data files: If the content doesn't fit into the cache blocks »Filename = <Hash number><type><generation number> - Type: d = cache, m = metadata (rare!) - Generation number: Lowest byte of location » No extension! \rightarrow Filename doesn't tell file type! - If known \rightarrow Rename \rightarrow Original file

E

IE-Example: Reconstructing a Webmail message

• Cookies:

- → www.gmx.net/de/
 - » Visits

» moveinBrowser

new%20MoveinData%28%29%2Eunpickle%28%7B%22viewed%22%3A%201%2C%20%22closed%22%3 A%20false%2C%20%22latest%22%3A%20new%20Date%281192174225718%29%7D%29

- Decoded: new MoveinData().unpickle({"viewed": 1, "closed": false, "latest": new Date(1192174225718)})
- -Decoded date (Unix): Fr, 12 October 2007 07:30:25 UTC

→ gmx.net/

» GUD

bMDEpJi1JPF9xN0JINkUyQkExJSIhJxweJBkeGyAvLjcsLDQpKzJCSzElliEnHB8dGRwclC83Ny8tNC0uMkt BMSMtSzksIh0gGw==

1192260804812

- -Mime encoded, but is just a binary value
- Probably a unique ID for session handling
- Jogout.gmx.net/

» POPUPCHECK

Sa, 13 Oktober 2007 07:33:24 UTC

Reconstructing a Webmail message

IE-Example:

- History (pasco; adjusts for local time zone!): _ 12.10.2007 7:30-7:33 UTC!
 - → Modified/access time: 10/12/2007 09:30 until 09:33

» Local time of event: Western European DST (=+2)

 But done according to the time zone set at the moment of the analysis; physically stored as UTC time!

• URLs (selection):

 - Ser downloaded an attachment called "Lebenslauf doc"

IE-Example: Reconstructing a Webmail message

Cache:	
→ 282 entries	
» Images (GIF, JPG)	
» Stylesheets (CSS)	
»JavaScript (JS)	
» HTML files (HTML)	
– Only static files, login screen, etc.!	
 What is missing are the actual E-Mails 	
→ These are not cached on disk	
» In previous versions they might have been cached	
 Probably depending on server, not version of Internet Explorer 	1
\rightarrow So webmail is not necessarily recoverable, but perhaps	

Other information: Careful interpretation necessary!

31

- Typed URLS: Visited sites
- Form history and stored passwords
 - → For identifying visited sites and accessing them
 - → Often encrypted, but decryption programs exist
- Search history: What was the person looking for?
- Blocked sites: If the popup-host of a site was blocked, the site itself was probably visited!
 - \rightarrow Manually unblocked sites obviously interesting!
- Certificate store: To identify secured sites visited often
 - → Might include client certificates, which act as a kind of key
- Download history: What file(names) were downloaded
 - → And where they were stored locally (name; for searching)
- Installed add-ons (browser controls)

Language preferences and all other configuration options
 Michael Sonntag

Conclusions

- What a user did with a web browser can usually be reconstructed quite good
 - → Especially Internet Explorer: Deleting the index.dat files is almost impossible
 - » Dedicated "cleaner" programs are needed
 - Information may be stored multiple times
- Reconstructing the content of web-based E-Mail is difficult
 - \rightarrow That, which, ... can be done
 - But content is typically not cached and therefore unavailable
- A variety of programs exist to investigate the files
 - → Few of them are free
 - → File formats are often not at all/badly documented
- Timestamps are very important, but many formats occur
 - \rightarrow Identifying delta and timezone are paramount!

Questions?

Thank you for your attention!
